CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rENA.
SUBUNIT: The Shiga-like toxins contain a single A subunit and multiple copies of B subunit.
SIMILARITY: Belongs to the ribosome-inactivating protein family.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 33,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 58,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence Sequence Sequence Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 8, Application US/11111664

Sequence 8, Application US/11111664

Publication No. US20060014687A1

GENERAL INFORMATION:

APPLICANT: ENDSIA PHRAMA INC.

APPLICANT: Crine, Philippe

APPLICANT: Loisel, Thomas

APPLICANT: Boileau, Guy

TITLE OF INVENTION: BONE DELIVERY CONJUGATES AND METHOD OF USING SAME TO TARGET

TITLE OF INVENTION: PROTEINS TO BONE

FILE REFERENCE: 2006078-0003

CURRENT APPLICATION NUMBER: US 60/563, 828

PRIOR PRILING DATE: 2004-04-21

PRIOR APPLICATION NUMBER: US 60/614,984

PRIOR FILING DATE: 2004-07-23

NUMBER OF SEQ ID NOS: 44

SEQ ID NO 8

(XOMA) XOMA CORP.

SP; Lei Lane JA, Carroll SF, Better MD, Berhard SL,

WPI; 1993-167617/20.

Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in-vivo.

Example 10; Page 115; 163pp; English.

The invention covers analogues of the plant type I RIP gelonin which have a non-naturally occurring Cys residue in a position which enables the analogue to be conjugated via a disulphide linkage to a molecule which

disorders. Such conditions include ovarian cancer and breast cancer, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to CDNAs encoding them (ABC54131-ABC56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigen of ovarian antigen of ovarian antigen of ovarian antigen of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related
specifically binds to a target cell. Pref. target-cell binding molecules are antibodies or their fragments, esp. human engineered H65 antibody fragments. Fusion constructs were assembled that included a natural sequence galonin gene fused to an H65 truncated heavy chain gene or an H65 light chain (kappa) gene. A DNA linker encoding a peptide segment of the rabbin muscle aldolase was inserted between the gelonin gene and the Ab gene. The resulting immunoconjugates can be used as cytotoxic therapeutic agents. (Updated on 25-MAR-2003 to correct PN field.)

                   The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a mucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an axpression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions the invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer. Tenal cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.

Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information is exceived from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors,
               biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the
                                                                          interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides mucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

```
neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as paraaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the CDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the
                                                                                                                                                                                                                                                                                                                                                                                                invention.

Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.

Claim 1; SEQ ID NO 537; 180pp; English.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for

The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a
identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, setecarthritis, Leber's hereditary optic neuropathy (HADN), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition comprising several cDNAs that are differentially expressed in treated human C3A liver cell cultures, useful for treating liver

The method comprises a search unit searching homology of a candidate sequence determined by a primer probe designing unit, for determining homologous presence or absence of a determined candidate sequence. The method of the invention is useful for the preparation of a microarray, such as a cDNA microarray. The present amino acid sequence represents a human fructose-
                                                                                ဌ
molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a cDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene database production method for microarray preparation, comprises searching homology of a candidate sequence determined by a primer probe designing unit, for a matching candidate sequence.

Use of an inhibitor of a member of a biological pathway for inhibiting, suppressing, treating, or preventing human immunodeficiency virus (HIV)

Claim 1; SEQ ID NO 22; 143pp; English.

infection.

```
The present sequence is that of human fructose bisphosphate aldolase A (ALDOA), which has been identified as a cellular target for HIV collibriation. The invention relates to methods for identifying human cellular genes that encode products that are necessary for productive HIV infection for use as targets in the design of therapeutic agents for suppressing HIV infection. The invention also includes methods for identifying biological pathways comprising the products of such cellular genes, as well as substrates and methodic products of these pathways.

Condensity of therapeutic agents for suppressing HIV infection. It also relates to methods for identifying protective compounds that inhibit HIV the compounds include chemical compounds such as small molecule infection and to the use of such compounds such as small molecule inhibitors or substrate compounds such as products of chemical compounds include chemical compounds including peptides, antisense molecules and antibodies in one embodiment of the invention, the target gene encodes a target product that is a member of the invention, the target gene encodes a target product that is a member of the compute gare encodes a target product that is a member of the compute gare constructed from mRNA isolated from ML-60 and Hela cells, and from phychaemagglutinin-stimulated peripheral blood monouclear cells, and from the carloty pressor elements (GSBS) exhibiting HIV suppressive activity. The human cellular genes from which these GSBS were derived ectived and included the ALDOA gene from a PBMC library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpreaded in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide manals. The invention also relates to nucleic acid and polypeptide polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibodies, antagonist, minimation of the properties and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide of the invention
                                                                                                                          Tumour-associated antigenic target (TAT) polypeptide PRO69617, SEQ:4521.

                                                                                                                                                                                        This sequence represents the aldolase A fructose bisphosphate. This sequence may be used in the method of the invention for identifying a mammal at increased risk for developing breast cancer. The method comprises correlating the level of at least one biomarker with a baseline level and identifying a mammal at increased risk for developing breast cancer based on the correlation. The method is useful for identifying a mammal at increased risk for developing breast cancer. In the method is useful for identifying a useful for prognosing breast cancer in a mammal and for identifying breast cancer in a mammal, by measuring the level of a biomarker such as a protein or an mRNA transcript of the biomarker.
Identifying a mammal at increased risk for developing breast cancer by correlating the level of at least one biomarker with a baseline level and identifying a mammal at increased risk for developing breast cancer based

The invention relates to providing a patient diagnosis for lung cancer comprising comparing the level of expression of genes or gene products in a biological sample from a normal level of expression of genes or gene products in a biological sample from a normal individual.

Also included are distinguishing between normal and disease tissues, connitoring the response of a patient being treated for lung cancer by administering an anti-cancer agent, identifying a compound useful for the treatment of lung cancer and an array for distinguishing between normal and disease tissues (comprising 2 or more probes corresponding to 2 or more genes selected from any of the 200 nucleotide sequences given in the specification, or 2 or more polypeptides comprising any of the 200 amino acid sequences given in the specification). In providing a patient acid sequences given in the specification, or one or more gene products are polypeptides selected from any of the 200 nucleotide sequences as mentioned in the specification, or one or more gene products are polypeptides selected from any of the 200 nucleotide sequence mentioned in the specification, or one or card sequence mentioned in the specification, or one or card sequence mentioned in the specification, or one or card sequence mentioned in the specification, are useful for detecting and optimizing therapeutics for cancer. The present sequence contentifying and optimizing therapeutics for cancer. The present sequence contentifying and optimizing therapeutics for cancer. The present sequence contentifying and optimizing therapeutics for cancer. The present sequence copies sequence and sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                   Providing a patient diagnosis for lung cancer comprises comparing the level of expression of genes or gene products in a biological sample from the patient with that from a normal individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumor marker; lung tumor; cytostatic; neoplasm; expression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method of predicting or determining whether a mammal will respond or is responding to an anti-cancer agent that modulates cyclin-dependent kinase (cdk) activity. The method comprises measuring the level of one or more blomarkers selected from 2774 biomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred. The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed microarrays comprising the biomarkers described, antibodies directed microarrays biomarkers and a cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[[5-(1.1-blmethylethyl)*2-coxazolylmethyl]thio}-2-thiazolyl-4-piperidine carboxamide, 0.5-L-trataric acid salt. Note: The sequence data for this patent did not form tarraic acid salt. Note: The sequence data for this patent did not form directly from WIPO at ftp.wipo.intt/pub/published pot sequences. This sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Biomarkers useful for predicting or determining the response of a mammal to a cancer treatment comprising administration of a modulator of cyclin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to providing a patient diagnosis for lung cancer comprising comparing the level of expression of genes or gene products in a biological sample from the patient with the level of expression of genes or gene products in a biological sample from a normal individual.

Also included are distinguishing between normal and disease tissues, conditionable of a patient being treated for lung cancer by administering an arti-cancer agent, identifying a compound useful for the treatment of lung cancer and an array for distinguishing between normal and disease tissues (comprising 2 or more probes corresponding to 2 or more genes selected from any of the 200 nucleotide sequences given in the specification, or 2 or more polypeptides comprising any of the 200 nucleotide sequences given in the specification). In providing a patient diagnosis for lung cancer, one or more genes are selected from any of the 200 nucleotide sequences as mentioned in the specification, or one or concept more gene products are polypeptides selected from any of the 200 nucleotide sequences as mentioned in the specification, or one or concept more gene products are polypeptides selected from any of the 200 nucleotide sequences and mentioned in the specification. The methods are useful for detecting and treating lung cancer. These may also be used for designing, identifying and optimizing therapeutics for cancer. The present sequence represents a protein from one of the 200 lung cancer marker genes. Note:

The sequence data for this patent did not form part of the printed propertions of the 200 lung cancer marker genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                   Providing a patient diagnosis for lung cancer comprises comparing the level of expression of genes or gene products in a biological sample from the patient with that from a normal individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to a novel method for comprehensive identification of a beta amyloid-binding protein, which is expressed in the brain and has a capacity to bind with beta amyloid 40. The method comprises performing a proteomic technique. The method of the invention neuroprotective and nootropic applications. The method of the invention may be useful in screening for a compound which inhibits the interaction between beta amyloid and a beta amyloid-binding protein. The beta amyloid between the current sequence is that of a murine brain-derived peptide of the invention which binds to beta amyloid.
                                        Comprehensive identification of beta amyloid binding protein expressed in brain, for use against Alzheimer's disease, comprises performing a proteomic technique.

fuctose 1,6-bisphosphate aldolase - fruit fly (Drosophila melanogaster)
C;Species: Drosophila melanogaster
C;Species: Drosophila melanogaster
C;Stecies: Drosophila melanogaster
C;Stecies: O4-Mar-1993 #sequence_revision 18-Nov-1994 #text_change 09-Jul-2004
C;Accession: C42263
M;Shaw-Lee, R.; Lissemore, J.L.; Sullivan, D.T.; Tolan, D.R.
J. Blol. Chem. 267, 3595-3567, 1992
A;Tille: Alternative splicing of fructose 1,6-bisphosphate aldolase transcripts in Drosc
A;Reference number: A42263; MUID:92156139; PMID:1740444
A;Reference number: A42263; MUID:92156139; PMID:1740444
A;Retaus: preliminary
A;Molecule type: DNA
A;Reterences: UNIPROT: P07764; UNIPARC:UPI00001248A2; GB:M98351; GB:M76409; NID:g15
A;Note: sequence extracted from NCBI backbone (NCBIN:82659, NCBIP:93286)

 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 The invention covers analogues of Type I RIPs. Gelonin is a Type I RIP and the analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment. See AAR37291 for gelonin amino acid sequence. (Updated on 25-MAR-2003 to correct PN
was used to construct the various analogues. Primer geloC-20 was used in the substn. of Ile103 of gelonin by Cys. (Updated on 25-MAR-2003 to correct PN field.)
 Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

proteolytic peptide fragments of native gelonin were sequenced. PCR primers were designed based on these peptide fragments. The primers were teat to amplify segments of cDNA covering the 5'-terminal, middle and 3'-terminal regions of the gelonin coding sequence. A composite gelonin gene sequence was assembled from the overlapping gelonin DNA fragments (see AAA92222). Having cloned the gelonin gene, the development of gelonin analogues and gene fusions is facilitated. See AAR37291 for gelonin amino acid sequence. (Updated on 25-MAR-2003 to correct PN field.)

Analogues of Type I RIP are defined as non-naturally occurring
polypeptides that share the ribosome-inactivating activity of the natural
protein but differ in AB sequence. Preferred analogues have a CyB
available for disulfide bonding located at a posn. it its AA sequence
from the posn. corresp. to posn. 251 in ricin A-chain RTA to the carboxy
ce terminus of the analogue. (AARY4176 is the sequence of ricin A-chain RTA,
which is a Type II RIP). The primary AA sequence of ricin A-chain RTA,
which is a Type II RIP). The primary AA sequence of the Type I RIPS
gelonin, BRIP, mormordin II, luffin [see Islam et al. Agricultural
CC Biological Chem., 265, 8670-74 1990], momordin I [see Ho et al., BBA,
IN Biol. Chem., 264 (12) 6629-37 1989], pokeweed antiviral protein isolated
from seeds [see Kung et al., Agric. Biol. Chem., 54 (12), 3301-18 1990]
cn daporin [see Banatti et al., Bur. J. Biochem., 183, 465-70 1989] are

 AAQ75532 encodes AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

```
fusion protein and is suitable for introduction into a bacterial host.

The vector comprises: (a) DNA encoding at least one cationic

The vector comprises: (a) DNA encoding at least one cationic

Datericidal/permeability increasing peptide (BPI), (b) DNA encoding a

carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site

Coarrier protein, and (b). The present sequence represents the pING3797

vector construct coding for a BPI fusion protein. The peptides have many

uses including the treatment of bacterial and fungal infections. BPI

ceptides also bind to endotoxins and heparin, neutralising their effects.

The peptides have further been shown to inhibit anglogenesis (partly due

to heparin-binding activity). The fusion proteins have been found to be

expressed in large amounts without significant proteolysis, and in some

cases are actually secreted from the host cells. This allows the indirect

production of anti-microbial BPI peptides in microbial hosts
 Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving the BPI peptide from the carrier.

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cerrical, oesophagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative diseases, cardiovascular diseases, pathogenic diseases, and diabetes. The method provides less antigenic proteins, peptides and polypeptides, which are more effective than prior art. The present sequence encodes murine single-chain ZME-018 antibody/G. multiflorum recombinant gelonin (rGel) (scfwMEL/rGel) fusion protein

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S. aureus DNA sequences allows putative functions to be assigned so industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The Dolypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numencous human diseases, including cellulities, eyelid infections, food poisoning, osteomyelities, and surgical wound infections, scaled akin syndrome, toxic shocks and the second of the second o
 syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the computer
 /*tag= a //note= "these bases represent a line of missing text in the sequence listing in the specification. They are included to maintain the nucleotide numbering given in
 Polynucleotide(s) and proteins derived from Staphylococcus aureus -
stored on computer readable medium and used in the production of anti-
S.aureus vaccines.

 The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nutleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a parient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of
 New Staphylococcus aureus protein, useful as a vaccine for treating or preventing Staphylococcal infection, specifically an infection caused by

This DNA encodes human immunoglobulin E (IgE) high affinity receptor beta subunit (Fc epsilon RI beta) exon 7 variant E237G. This variant is associated with atopy and atopic asthma. The variation is in exon 7 and is a nucleotide change from adenine to guanine at nucleotide 7297 (nucleotide 6843 in the Fc epsilon RI beta gene sequence of Kuster, et al. 1992). Detection of the protein is useful for diagnosis of atopy. In particular the E273G polymorphism may also define a subgroup of asthma

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Studnicka GM; Carroll SF, Better MD,

WPI; 1995-006804/01.

Polynucleotide(s) encoding type I ribosome-inactivating proteins - which are suitable for use as components of cytotoxic therapeutic agents.

Example 3; Page 181-182; 221pp; English.

AAR63912-R63924 are analogs of AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. Thes are key components of cytocoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

 The invention describes an isolated peptide or polypeptide having an anti-
tumour and antiviral activity. Also described is a composition
comprising the isolated peptide or polypeptide, and a carrier, excipient
or auxiliary agent. Specifically claimed are MAP30 or GAP31 peptides or
polypeptides. The peptide or polypeptide is useful for treating HIV
infection, and tumour. This is the amino acid sequence of Gelonium anti-
HIV protein 30kDa (MAP30).

subject or a second subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds for example gelonin toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, axin liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, oesophagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthritis, inflammatory diseases, cardiovascular diseases, pathogenic arthritis, inflammatory diseases, cardiovascular diseases, pathogenic cancer, the method provides less antigenic proteins, peptides and polypeptides, which are more effective than prior art. The present sequence represents G. multiflorum recombinant gelonin (rGel)

 The invention relates to a composition comprising a conjugate of an antibody exhibiting binding specificity for an extracellular epitope of cense. 2 protein and a plant derived toxin, where the toxin is pharmacologically effective against neoplastic cells and is selected from gelonin, full length recombinant gelonin, functional gelonin fragments or composition comprising the composition above and a pharmaceutical composition comprising the composition above and a pharmaceutical vehicle. For treating neoplastic diseases, e.g. human mammary carcinomas, human ovarian carcinomas, lung carcinomas, gastric tumors, salivary gland adenocarcinomas, or colon adenocarcinomas. The present sequence represents a scPv23-gelonin amino acid sequence, which is used in an example from the present invention.

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, ossophagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial
 Generating a modified protein with reduced antigenicity for treating cancer, AIDS, autoimmune diseases, comprises identifying a protein region antigenic in the first subject using antiserum from either the first or a

 A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host. The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site located between (a) and (b). The present sequence represents the protein from the pING3797 vector construct which codes for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit anglogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without
 significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation - the Buropean Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
 01-OCT-1993 (Rel. 27, Created)
01-NOV-1995 (Rel. 32, Last sequence update)
10-MAY-2005 (Rel. 47, Last amnotation update)
Ribosome-inactivating protein gelonin precursor (EC 3.2.2.22) (FRWA N-
 Montecucchi P.-C., Lazzarini A.M., Barbieri L., Stirpe F., Soria M.,
 "X-ray structure of gelonin at 1.8-A resolution.";
J. Mol. Biol. 250:368-380(1995).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at o specific adenosine on the 28S rRNA.
-!- SUBJUNT: Homodimer.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
Type 1 RIP subfamily.

type 2 ribosome-inactivating protein from the bark of Sambucus nigra
 precedes endocytosis.
CARALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at specific adenosine on the 28S rRNA.
SUBUNIT: Disulfide-linked dimer of A and B chains.
SIMIGARITY: In the N-terminal section; belongs to the ribosome-similarity protein family. Type 2 RIP subfamily.
SIMILARITY: Contains 2 ricin B-type lectin domains.
